How to Create Lambda Function into AWS.
----

1) Lambda Function Steps:

1)	Goto Aws website and logging with root user
2)	Search Lambda and click on create button
3)	Give name of your lambda function and select python
4)	Search Api gateway and create Api with POST method and link with your lambda function
5)	After that create new stage and deploy your Api
6)	You can see some link after successfully deploy and paste this link into hashtag.py file.
7)	Follow same steps to create another lambda function but you need to change POST method to GET method than paste deploy key into hashtag.py file.

2) DynamoDB Function Steps:

1)	Goto Aws website and logging with root user
2)	Search DynamoDB and click on create button
3)	Give name of your DynamoDB table
4)	Give columns name and create DB
5)	Replace DB name with columns name into the lambda function
6)	Now run the hashtag.py file into streamlit
